

ANNEALING HARVEST EVENT TESTCASE COLLECTION WITHIN A BATCH SIMULATION FARM

ABSTRACT OF THE DISCLOSURE

A method and system for resolving testcase collection inconsistencies between a testcase list which includes testcases that have triggered harvest events within a simulation model, and a harvest hit table which records harvest events that have been triggered during simulation of the simulation model. First, the harvest hit table is updated from a simulation client to include a harvest event triggered by a testcase during simulation of the simulation model. The testcase is then collected within the testcase list. Finally, testcases identified within the testcase list are compared to testcases identified within the harvest hit table to determine inconsistencies therebetween.
